Abstract. Legislation and case law are widely published on the Web as HTML and PDF documents for humans to read. In contrast, this paper argues for publishing legal documents as Linked Open Data (LOD) on top of which intelligent legal services for end users can be created in addition to just providing the documents for close reading. To test and demonstrate this idea, we present work on creating the Linked Open Data service SEMANTIC FINLEX for Finnish legislation and case law and the semantic portal prototype LAWSAMPO for serving end users with legal data. SEMANTIC FINLEX is a harmonized knowledge graph that is created automatically from legal textual documents and published in a SPARQL endpoint on top of which the various applications of LAWSAMPO are implemented. First applications include faceted semantic search and browsing engines for 1) statutes and 2) court decisions, as well as 3) a service for finding court decisions similar to a given one. A novelty of LAWSAMPO is the provision of ready-to-use tooling for exploring and analyzing legal documents, based on the "Sampo" model.

Keywords: linked data · case law · legislation · semantic portal

1 Semantic Finlex Linked Open Data Service

In Finland, legislation and case law has been published as web documents since 1997 as web documents in the Finlex Data Bank5. Although the Finlex service is widely used by the public, it does not provide machine-readable legal information as open data, on top of which services and analyses could be built by the ministry or third party vendors. The first version of SEMANTIC FINLEX based on Linked Data was published in 2014 [3].
The data included 2413 consolidated laws, 11904 judgments of the Supreme Court, and 1490 judgments of the Supreme Administrative Court. In addition, some 30000 terms used in 26 different thesauri were harvested for a first draft of a consolidated vocabulary. During this work, some shortcomings of the initial RDF data model became evident as well as the need for using the then emerging new standards for EU level interoperability: ELI European Legislation Identifier [2] and ECLI European Case Law Identifier [1]. The demo dataset also consisted of only one temporal version (2012) of the statutory law and was not updated automatically, as new legislation and case law was published in Finlex. These issues were resolved in the new version of the SEMANTIC FINLEX [8].

The Semantic Finlex service adopts the 5-star Linked Data model [6] extended with two more stars, as suggested in the Linked Data Finland model and platform [6]. The 6th star is obtained by providing the dataset schemas and documenting them. Semantic Finlex schemas can be downloaded from the service and the data models are documented under the data.finlex.fi domain. The 7th star is achieved by validating the data against the documented schemas to prevent errors in the published data. Semantic Finlex attempts to obtain the 7th star by applying different means of combing out errors in the data within the data conversion process. The service is powered by the Linked Data Finland publishing platform that along with a variety of different datasets provides tools and services to facilitate publishing and re-using Linked Data. All URIs are dereferenceable and support content negotiation by using HTTP 303 redirects. In accordance with the ELI specification, RDF is embedded in the HTML presentations of the legislative documents as RDFa markup. In addition to the converted RDF data, the original XML files are also provided. To support easier use by programmers without knowledge of SPARQL or RDF, a simplified REST API is provided, too.

2 LAWSAMPO Semantic Portal

To demonstrate and test using the SEMANTIC FINLEX in applications, the semantic portal LAWSAMPO is under development. LAWSAMPO is a new member of the Sampo [9] series of semantic portals, based on the “Sampo model” [5], where the data is enriched through a shared ontology and Linked Data infrastructure, multiple application perspectives are provided through a single SPARQL endpoint, and faceted search and browsing is integrated with data-analytic tooling in the user interface. The faceted search and tooling are implemented using the Sampo-UI framework [10]. The Sampo portals [11] have had millions of end users on the Web suggesting that it is a promising model to create useful semantic portals.

---

[9] In Finnish mythology and the epic Kalevala, “Sampo” is a mythical artefact of indeterminate type that gives its owner richness and good fortune, an ancient metaphor of technology.
The landing page of the LAWSAMPO portal offers three application perspectives:

1. **Statutes.** By clicking on Statutes, a faceted search interface for searching and browsing statutes is opened. The facets on the left include document type (with seven subtypes), statute type, year, and related EU directive. After filtering out a set of documents (or a particular document) of interest, the user is provided with two options. First, the user can select a document from the result list and a “homepage” of the document opens, showing not only the document but also linked contextual information related to it. For example, the court decision in which the statute has been applied can be shown. Second, it is possible to do data analysis based on the filtered documents. For example, a histogram can be created showing the dates of the filtered documents.

2. **Case Law.** In the Case Law perspective, a similar faceted search interface opens for searching and browsing court decisions. In this case, the facets include court, judge, and keywords characterizing the subject matter of the judgement.

3. **Case Law Search.** The third perspective is an application, where a law case judgement, or more generally any document or text, can be used for finding similar other case judgements. For example, if one gets a judgement from a court, this application can be used to find out what kind of similar judgements have been made before. Several methods for finding similar cases were tested when implementing this application including TF-IDF, Latent Dirichlet Allocation (LDA), Word2Vec, and Doc2vec.

### 3 Related Work and Contributions

Our work on legal Linked Data services was influenced by the MetaLex Document Server that publishes Dutch legislation using the CEN MetaLex XML and ontology standards. Other MetaLex ontology based implementations include legislation.gov.uk for UK legislation and Nomoseis that also implements ELI-compliant identifiers. Various ELI implementations and prototypes have also been implemented and used in related existing legal information portals nationally, e.g., in Luxembourg, France, and Norway. Many countries already produce ECLI-compliant case law documents to be indexed by the ECLI search engine. A prominent example of publishing EU Law and publications as linked data is the CELLAR system.

**LAWSAMPO** aims to widen the focus of these related works by providing both legislation and case law to end users through intelligent user interfaces, such as semantic faceted search and document similarity-based search. The documents are automatically enriched with contextual linked data on their “homepages”, and the end user is also provided with ready-to-use data-analytic tooling for analyzing the documents and their relations. In the future, we plan to expand the related enriching datasets to include, e.g.,
